Homework 6

1.

a. $P(A, A, B)$ $P(x, y, z)$
 $\Theta = \{x/A, y/A, z/B\}$

b. $Q(y, G(A, B))$ $Q(G(x, x), y)$
can't be unified b/c can't bind x to A and B

c. $R(x, A, z)$ $R(B, y, z)$
 $\Theta = \{x/B, y/A\}$

d. $Older(Father(y), y)$ $Older(Father(x), John)$
 $\Theta = \{x/John, y/John\}$

e. $Knows(Father(y), y)$ $Knows(x, x)$
no valid unifier because that would imply
 y is its own father, which does not make sense

2.

- John likes all kinds of food.
- Apples are food.
- Chicken is food.
- Anything someone eats and isn't killed by is food.
- If you are killed by something, you are not alive.
- Bill eats peanuts and is still alive. *
- Sue eats everything Bill eats.

a. First-Order sentences:

- $\forall x \text{ Food}(x) \Rightarrow \text{Likes}(\text{John}, x)$
- $\text{Food}(\text{Apples})$
- $\text{Food}(\text{Chicken})$
- $\forall x (\exists y \text{ Eats}(y, x) \wedge \neg \text{Kills}(x, y)) \Rightarrow \text{Food}(x)$
- $\forall x (\exists y \text{ Kills}(y, x)) \Rightarrow \neg \text{Alive}(x)$
- $\text{Eats}(\text{Bill}, \text{Peanuts}) \wedge \text{Alive}(\text{Bill})$
- $\forall x \text{ Eats}(\text{Bill}, x) \Rightarrow \text{Eats}(\text{Sue}, x)$

6. convert to CNF

1. eliminate \Rightarrow , \Leftrightarrow :

- $\forall x \neg \text{Food}(x) \vee \text{Likes}(\text{John}, x)$
- $\text{Food}(\text{Apples})$
- $\text{Food}(\text{Chicken})$
- $\forall x \neg (\exists y \text{Eats}(y, x) \wedge \neg \text{Kills}(x, y)) \vee \text{Food}(x)$
- $\forall x \neg (\exists y \text{Kills}(y, x)) \vee \neg \text{Alive}(x)$
- $\text{Eats}(\text{Bill}, \text{Peanuts}) \wedge \text{Alive}(\text{Bill})$
- $\forall x \neg \text{Eats}(\text{Bill}, x) \vee \text{Eats}(\text{Sue}, x)$

2. move \neg inwards

- $\forall x \neg \text{Food}(x) \vee \text{Likes}(\text{John}, x)$
- $\text{Food}(\text{Apples})$
- $\text{Food}(\text{Chicken})$
- $\forall x [\forall y \neg \text{Eats}(y, x) \vee \text{Kills}(x, y)] \vee \text{Food}(x)$
- $\forall x [\forall y \neg \text{Kills}(y, x)] \vee \neg \text{Alive}(x)$
- $\text{Eats}(\text{Bill}, \text{Peanuts}) \wedge \text{Alive}(\text{Bill})$
- $\forall x \neg \text{Eats}(\text{Bill}, x) \vee \text{Eats}(\text{Sue}, x)$

3. standardize variables:

- $\forall a \neg \text{Food}(a) \vee \text{Likes}(\text{John}, a)$
- $\text{Food}(\text{Apples})$
- $\text{Food}(\text{Chicken})$
- $\forall b [\forall c \neg \text{Eats}(c, b) \vee \text{Kills}(b, c)] \vee \text{Food}(b)$
- $\forall d [\forall e \neg \text{Kills}(e, d)] \vee \neg \text{Alive}(d)$
- $\text{Eats}(\text{Bill}, \text{Peanuts}) \wedge \text{Alive}(\text{Bill})$
- $\forall f \neg \text{Eats}(\text{Bill}, f) \vee \text{Eats}(\text{Sue}, f)$

4. skolemize - there aren't any \exists

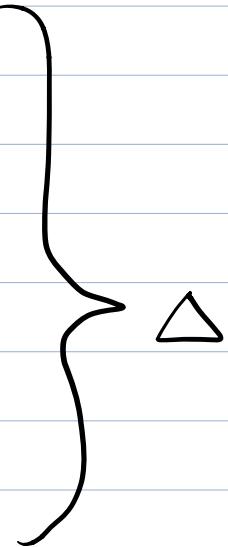

5. drop universal quantifiers

- $\neg \text{Food}(a) \vee \text{Likes}(\text{John}, a)$
- $\text{Food}(\text{Apples})$
- $\text{Food}(\text{Chicken})$
- $\neg \text{Eats}(c, b) \vee \text{Kills}(b, c) \vee \text{Food}(b)$
- $\neg \text{Kills}(e, d) \vee \neg \text{Alive}(d)$
- $\text{Eats}(\text{Bill}, \text{Peanuts}) \wedge \text{Alive}(\text{Bill})$
- $\neg \text{Eats}(\text{Bill}, f) \vee \text{Eats}(\text{Sue}, f)$

6. distribute - nothing to distribute

CNF clauses:

1. $\neg \text{Food}(a) \vee \text{Likes}(\text{John}, a)$
2. $\text{Food}(\text{Apples})$
3. $\text{Food}(\text{Chicken})$
4. $\neg \text{Eats}(c, b) \vee \text{Kills}(b, c) \vee \text{Food}(b)$
5. $\neg \text{Kills}(e, d) \vee \neg \text{Alive}(d)$
6. $\text{Eats}(\text{Bill}, \text{Peanuts})$
7. $\text{Alive}(\text{Bill})$
8. $\neg \text{Eats}(\text{Bill}, f) \vee \text{Eats}(\text{Sue}, f)$

c. Prove John likes peanuts using resolution

Δ : CNF clauses on prev. page

α : Likes(John, Peanuts)

- To prove $\Delta \models \alpha$, we prove that $\Delta \wedge \neg \alpha$ is unsatisfiable:

1. $\neg \text{Food}(a) \vee \text{Likes}(\text{John}, a)$
2. $\text{Food}(\text{Apples})$
3. $\text{Food}(\text{Chicken})$
4. $\neg \text{Eats}(c, b) \vee \text{Kills}(b, c) \vee \text{Food}(b)$
5. $\neg \text{Kills}(e, d) \vee \neg \text{Alive}(d)$
6. $\text{Eats}(\text{Bill}, \text{Peanuts})$
7. $\text{Alive}(\text{Bill})$
8. $\neg \text{Eats}(\text{Bill}, f) \vee \text{Eats}(\text{Sue}, f)$
9. $\neg \text{Likes}(\text{John}, \text{Peanuts})$
10. $\neg \text{Kills}(e, \text{Bill}) \quad 5, 7 \quad \Theta = \{d/\text{Bill}\}$
11. $\neg \text{Food}(\text{Peanuts}) \quad 1, 9 \quad \Theta = \{a/\text{Peanuts}\}$
12. $\neg \text{Eats}(c, \text{Peanuts}) \vee \text{Kills}(\text{Peanuts}, c) \quad 4, 11 \quad \Theta = \{b/\text{Peanuts}\}$
13. $\text{Kills}(\text{Peanuts}, \text{Bill}) \quad 6, 12 \quad \Theta = \{c/\text{Bill}\}$
14. empty clause (contradiction) $10, 13 \quad \Theta = \{e/\text{Peanuts}\}$

Since we found a contradiction, $\Delta \wedge \neg \alpha$ is unsatisfiable, so $\Delta \models \alpha$: John likes peanuts.

d. What does Sue eat?

1. $\neg \text{Food}(a) \vee \text{Likes}(\text{John}, a)$
2. $\text{Food}(\text{Apples})$
3. $\text{Food}(\text{Chicken})$
4. $\neg \text{Eats}(c, b) \vee \text{Kills}(b, c) \vee \text{Food}(b)$
5. $\neg \text{Kills}(e, d) \vee \neg \text{Alive}(d)$
6. $\text{Eats}(\text{Bill}, \text{Peanuts})$
7. $\text{Alive}(\text{Bill})$
8. $\neg \text{Eats}(\text{Bill}, f) \vee \text{Eats}(\text{Sue}, f)$
9. $\text{Eats}(\text{Sue}, \text{Peanuts}) \quad 6, 8 \quad \Theta = \{f / \text{Peanuts}\}$

Through resolution, we derived the sentence $\text{Eats}(\text{Sue}, \text{Peanuts})$.
Therefore, Sue eats Peanuts.

e.

new sentences:

- If you don't eat, you die
- If you die, you are not alive
- Bill is alive

FOL:

- $\forall g \neg [\exists h \text{ Eats}(g, h)] \Rightarrow \text{Die}(g)$
- $\forall i \text{ Die}(i) \Rightarrow \neg \text{Alive}(i)$
- $\text{Alive}(\text{Bill})$

convert new sentences to CNF:

1. eliminate \Rightarrow

- $\forall g [\exists h \text{ Eats}(g, h)] \vee \text{Die}(g)$
- $\forall i \neg \text{Die}(i) \vee \neg \text{Alive}(i)$
- $\text{Alive}(\text{Bill})$

2. done

3. done

4. skolemize

- $\forall g [\text{Eats}(g, F(g))] \vee \text{Die}(g)$
- $\forall i \neg \text{Die}(i) \vee \neg \text{Alive}(i)$
- $\text{Alive}(\text{Bill})$

5. drop universal quantifiers

- $\text{Eats}(g, F(g)) \vee \text{Die}(g)$
- $\neg \text{Die}(i) \vee \neg \text{Alive}(i)$
- $\text{Alive}(\text{Bill})$

6. done

Now we use resolution to derive what Sue eats:

1. $\neg \text{Food}(a) \vee \text{Likes}(\text{John}, a)$
2. $\text{Food}(\text{Apples})$
3. $\text{Food}(\text{Chicken})$
4. $\neg \text{Eats}(c, b) \vee \text{Kills}(b, c) \vee \text{Food}(b)$
5. $\neg \text{Kills}(e, d) \vee \neg \text{Alive}(d)$
6. $\neg \text{Eats}(\text{Bill}, f) \vee \text{Eats}(\text{Sue}, f)$
7. $\text{Eats}(g, F(g)) \vee \text{Die}(g)$
8. $\neg \text{Die}(i) \vee \neg \text{Alive}(i)$
9. $\text{Alive}(\text{Bill})$
10. $\neg \text{Die}(\text{Bill})$ 8, 9 $\Theta = \{i/\text{Bill}\}$
11. $\text{Eats}(\text{Bill}, F(g))$ 7, 10 $\Theta = \{g/\text{Bill}\}$
12. $\text{Eats}(\text{Sue}, F(g))$ 6, 11 $\Theta = \{f/F(g)\}$

derive

Since we can't[^] any more statements about what exactly Bill and Sue eat, we cannot conclude exactly what Sue eats.

#3: (Screenshot of my .txt file)

3.1. The SAT instance for 3-coloring graph 1 is not satisfiable.

3.2. The SAT instance for 4-coloring graph 1 is satisfiable.

3.3. The answers of these two SAT instances tell us that graph 2 can only be k-colored where $k \geq 4$.

A solution to coloring graph 1 is the following variable index assignments:

-1 -2 -3 4 -5 -6 7 -8 -9 10 -11 -12 -13 -14 15 -16 17 -18 -19 -20
-21 22 -23 -24 25 -26 -27 -28

Each of these variable indices was calculated using the formula:

$$\text{variable index} = (n - 1) * k + c$$

where $k = 4$, n is in $[1,7]$, and c is in $[1,4]$

A positive variable index indicates that a node was colored that color, so we can derive the following results from the assignments:

4 → node 1 was colored color #4
7 → node 2 was colored color #3
10 → node 3 was colored color #2
15 → node 4 was colored color #3
17 → node 5 was colored color #1
22 → node 6 was colored color #2
25 → node 7 was colored color #1

3.4. The minimum number of colors required to properly color graph 2 is 8.
